Backup

Agentless VMware & Hyper-V Backups: Backup single or multiple VMs from your ESXi/ Hyper-V hosts and also from your vCenter/Hyper-V clusters without installing any agent inside each VM

Near Continuous Data Protection: Schedule backups as often as every 15 minutes for lesser RPO

Incremental backups: Only the blocks changed since the previous backup are backed up in the successive incremental

Application-Aware backups: Ensure consistent backups of VSS aware applications such as MS Exchange Server, MS SQL Server, MS SharePoint and Active Directory

Advanced Retention Policies: Retain multiple recovery points that span days and years as per your requirements

Automated Backup Verification: With the latest available recovery point, the backup data is automatically booted as a VM to verify its recoverability

Backup level Encryption: Vembu provides end-to-end encryption (AES 256 bit) and lets you encrypt the data at rest and in flight through customized password

Replication

Agentless VM Replication: Replicate your VMware VMs from one ESXi host to another and get hold of your mission-critical VMs to stay periodically synced to the original

Failover & Failback: Instantly failover and failback the replica VM at the time of system crash or disaster to reduce business downtime

Network Mapping & Re-IP Settings: Automatically maps production host network and IP address with the DR host network to avoid manual labour during the failover of replicated VMs

Hosts

Microsoft Windows Server 2016, 2012 R2, 2012 R2 Core, 2012, 2008 R2, 2008 R2 Core

Virtual Machines

All OSs supported by Microsoft Hyper-V

Recovery

Instant Boot VM: Reduce the RTO by instantly booting your VMware/Hyper-V VM backup data as a VM on any hypervisor like VMware or Hyper-V or KVM

Full VM Recovery: Permanently restore the backed up data as a VM directly to the same or different hosts

File Level Recovery: Browse, search and instantly restore the required files and folders from the backup data

Disk Mount: Instantly access the backed up disks by mounting the backup data on the disk management of the local machine

Cross-Hypervisor Migration: Download the backup data into multiple virtual file formats like VHD, VHDX, VMDK, VMDK-FLAT & RAW and later use it to migrate the VMs across hypervisors

Application Item-level Recovery: Granularly browse and recover the individual application items of Microsoft Exchange, SharePoint, SQL and Active Directory

Disk Level Recovery: Restore backed up VMs at disk level to another VMs in an ESXi host

Storage & Management

Offsite Copy/DR: Replicate a copy of your backup data from the onsite backup server to an offsite server of your own or to Vembu Cloud for Disaster Recovery

Archive backups on Tapes: Replicate a copy of your backup data to tape media for long-term archival

Scale-out Repositories: Storage targets such as DAS, SAN and NAS can be incrementally added to the repository anytime without affecting the existing backup jobs

Efficient Storage Management: Vembu uses its proprietary VembuHIVE file system on top of the storage targets to enhance performance and scalability of the storage targets. It has in-built Compression, Deduplication, Encryption, Version Control and Error Correction

Email-Alerts: Enable email notifications to get alerts about the status of the configured backups (like success, failure, missed, etc.)

Group Management: Combine backup jobs or hosts/VMs to create groups with multiple users for easier management.
