Vembu extends support to Vembu v4.0 ImageBackup
Vembu Technologies

Experience 10+ YEARS

100+ Countries

Headquartered in Chennai
Vembu BDR Suite

Vembu BDR Suite is a portfolio of products designed to backup multiple environments from virtual to physical to cloud while addressing diverse and advanced use cases.

- **VMBackup**: Backup & Replication for VMware and Hyper-V
- **ImageBackup**: Backup & BMR for Physical Windows Servers and Desktops
- **NetworkBackup**: Backup for files/folders & applications
- **OffsiteDR**: Replicate a copy of your backup data off-site.

Understanding RPO and RTO

RTO (Recovery Time Objective)
Time duration to recover a backed up machine after disaster

RPO (Recovery Point Objective)
Until which point in time you can recover the machine data after disaster
Recovery Time Objective (RTO)

- The time taken for a business to recover from the occurrence of a disaster is RTO.
- Downtime is not something every business can afford.
- With Vembu, you can recover your virtual machines within a matter of minutes.
- Vembu adheres to the industry best RTO and RPO of <15 minutes.
Recovery Point Objective (RPO)

- The RPO for your business can be set by the maximum amount of data that you can afford to lose if disaster strikes
- With Vembu, you can retain even years worth of data
- You can also backup as frequently as every 15 minutes
- Also, near Continuous Data Protection ensures that you don’t lose even minutes’ worth of data
Deployment
On-premise Deployment - Simple

- Setup backup server in your local environment and backup via LAN connections
- Configure and manage backup jobs from BDR Backup Server GUI
- Backup your Windows machines to the local storage repositories
Hybrid Deployment - Scenario 1 (OffsiteDR)

- This deployment is recommended for large environments
- Setup DR site in your local environment and backup via LAN connections
- Send another copy of backup data to your own datacenter via LAN/WAN connection
- Ensure a disaster-resistant environment by signing up for Vembu OffsiteDR
Hybrid Deployment - Scenario 2 (CloudDR)

- This deployment is recommended for large environments
- Setup DR site in your local environment and backup via LAN connections
- Send another copy of backup data to Vembu Cloud via WAN connection
- Ensure a disaster-resistant environment by signing up for Vembu CloudDR
Remote office/Branch office

- Setup Vembu BDR backup server and Vembu Offsite DR server in both remote office as well as branch office
- Sync backup data between both the locations
Backup Server Clustering

- You can easily scale up the backup server when backup load increases
- Backup requests will be equally shared between each backup server
Product Highlights
Backup scheduling Options

- Backup scheduling helps you configure the schedule based on how frequently you want the successive backup jobs to run.
- User can choose from Hourly/Daily/Weekly options for the backup schedules from the console.
- The backups run automatically once the schedule is set. There’s no need for manual intervention.
Application-aware process is to create consistent database snapshots.

- This option allows you to stop the backup if any of the MS application writers are in an unstable state.
- Transaction log files can also be truncated. If not, then they can accumulate until they fill all the available disk space.
Compression and Encryption

- The backup data is compressed to reduce the storage needs
- The backup data is also encrypted using AES 256 algorithm both in-flight and at rest
- Users can save multiple customized encryption passwords along with a unique hint to ensure double protection for the backed up data
Backup Verification

- Backup verification can be automated to run post completion of every backup schedule or once in a day.

- In the process, booting of backed up VM will be carried out and screenshot of boot screen will be captured. This screenshot details will be sent to the administrators via email.
Vembu BDR Backup Server utilizes VembuHIVE™ file system to effectively manage storage repositories.

- Supports SAN, NAS and DAS
- Automatically scale up/out the storage devices
- In-built version control and error correction
- In-built Compression & Encryption
Migration Plan (P2V and V2V)

Vembu supports migration of machines from one environment to another.

- Vembu supports instant creation of VMDK, VHD and RAW files for backed up virtual/physical machines.
- Users can instantly start migrations like P2V(Physical to virtual) and V2V(between virtual environments)
Native Tape Backup

Vembu Native Tape Backup support helps organisations in implementing the best known 3-2-1 backup strategy of having 3 copies of your data in 2 different storage media and 1 backup copy offsite.

- Backing up to Tape is the only feasible option for long-term archival
- Automatically copy the backup data stored in Vembu BDR server to Tape Storage
- Media pools can be created for specific set of backup jobs and data can be efficiently archived
Vembu Universal Explorer

It is a tool that helps you recover individual items from various Microsoft Application backups like Exchange, SQL, SharePoint and AD

- Instantly restore emails/mailboxes from MS Exchange
- Instantly restore MS SQL databases and tables
- Restore documents of MS SharePoint
- Granularly recover MS Active Directory items
Managing Backup Jobs

Using Vembu, you can automate the backup process by scheduling through the web console. Once set, the incrementals will run as per the configuration and no manual intervention is required.

- Add backup schedule window settings if you don't want to run incrementals during non working hours
- Auto Authorization feature ensures that only the authorized clients can connect to the BDR
- Bandwidth Throttling enables you to limit the bandwidth used by the backup process from the client machine
Vembu Recovery CD

- Perform Bare-Metal Recovery of the backed up physical machine
- Recover entire disk or a particular partition of the backed up virtual or physical machine
- BCD boot configuration to configure the corrupted boot sector
- Inject VMDK driver directly to backed up data
- Perform P2P and V2P platform migrations
Architecture
Physical Server and Desktop - Image Backup

- Backup can either be performed from the Server console or by installing ImageBackup agent in each machine
- Snapshot of the selected disks is created using Microsoft VSS
- The snapshot of the full disk will be then compressed and encrypted before it leaves the source server or desktop
- Only the incrementals are transferred to the repository after initial full backup.
Disaster Recovery Scenarios
Bare-metal Recovery - P2P

Restore the backed up physical machine by using Vembu Recovery CD
Disk Level Restore

Restore only affected disks/partitions instead of restoring entire machine
Instant Recovery as a VM

Instantly boot the backed up physical machine on VMware, Hyper-V and KVM by mounting the backed up data to Vembu virtual drive.
Restore physical machine as a VM - P2V

Restore the backed up physical machine permanently to VMware ESXi host, Hyper-V and KVM
Instant File Level Restore

Restore files/folders from the backed up VM instantly without having to restore the entire backed up VM.
Instant Item Level Recovery - Vembu Universal Explorer

Vembu Universal Explorer helps you to restore Exchange mails, SQL database/tables, SharePoint documents and AD Users/Roles instantly.
Vembu Virtual Drive

- Vembu Virtual Drive will be available in Vembu BDR Backup Server machine and for every backed up machine, it will create a IMG, VHD, VHDX, VMDK, VMX file instantly.

- For every incremental schedule, full virtual hard disk files will be created without using any additional storage.
Licensing & Pricing
Licensing

Subscription

- Vembu offers licensing options for 1, 2, 3 and 5 years
- 24/7 support and major/minor upgrades included

Perpetual

- One time purchase with upgrades and support for one year
- AMC of 20% of license fee to be paid for continued support & updates

Available Editions

- Free
- Standard
- Enterprise
Pricing

- Vembu offers five pricing editions with features that cater to different levels of business requirements
