Vembu extends support to VMware Backup - Standard edition
Vembu Technologies

Experience 10+ Years

100+ Countries

Headquartered in Chennai
Vembu BDR Suite is a portfolio of products designed to backup multiple environments from virtual to physical to cloud while addressing diverse and advanced use cases.

**VMBackup**
Backup & Replication for VMware and Hyper-V

**ImageBackup**
Backup & BMR for Physical Windows Servers and Desktops

**NetworkBackup**
Backup for files/folders & applications

**OffsiteDR**
Replicate a copy of your backup data off-site.
Understanding RPO and RTO

RTO (Recovery Time Objective)
Time duration to recover a backed up machine after disaster

RPO (Recovery Point Objective)
Until which point in time you can recover the machine data after disaster
Recovery Time Objective (RTO)

- The time taken for a business to recover from the occurrence of a disaster is RTO.
- Downtime is not something every business can afford.
- With Vembu, you can recover your virtual machines within a matter of minutes.
- Vembu adheres to the industry best RTO and RPO of <15 minutes.
Recovery Point Objective (RPO)

- The RPO for your business can be set by the maximum amount of data that you can afford to lose if disaster strikes.
- With Vembu, you can retain even years worth of data.
- You can also backup as frequently as every 15 minutes.
- Also, near Continuous Data Protection ensures that you don’t lose even minutes’ worth of data.
On-premise Deployment - Simple

- Ideal setup for businesses looking to manage backups within their premises
- Setup DR site in your local environment and backup via LAN connections
- Configure and manage backup jobs from BDR Backup Server GUI
- Backup VMs to the local storage repositories
Hybrid Deployment - Scenario 1 (OffsiteDR)

- This deployment is recommended for large environments
- Setup DR site in your local environment and backup via LAN connections
- Send another copy of backup data to your own datacenter via LAN/WAN connection
- Ensure a disaster-resistant environment by signing up for Vembu OffsiteDR
Hybrid Deployment - Scenario 2 (CloudDR)

- This deployment is recommended for large environments
- Setup DR site in your local environment and backup via LAN connections
- Send another copy of backup data to Vembu Cloud via WAN connection
- Ensure a disaster-resistant environment by signing up for Vembu CloudDR
Remote office/Branch office

- Setup Vembu BDR backup server and Vembu Offsite DR server in remote office as well as branch office
- Sync backup data between both the locations
Product Highlights
Application Aware Process

Application-aware process is to create consistent database snapshots.

- This option allows you to stop the backup if any of the MS application writers are in an unstable state.
- Transaction log files can also be truncated. If not, then they can accumulate until they fill all the available disk space.
Compression and Encryption

- The backup data is compressed to reduce the storage needs
- The backup data is also encrypted using AES 256 algorithm both in-flight and at rest
- Users can save multiple customized encryption passwords along with a unique hint to ensure double protection for the backed up data
Efficient Storage Management

Vembu BDR Backup Server utilizes VembuHIVE™ file system to effectively manage storage repositories.

- Supports SAN, NAS and DAS
- Automatically scale up/scale out the storage devices
- In-built version control and error correction
- In-built Compression & Encryption
Migration Plan (P2V and V2V)

Vembu supports migration of machines from one environment to another.

- Vembu supports instant creation of VMDK, VHD and RAW files for backed up virtual/physical machines
- Users can instantly start migrations like P2V(Physical to virtual) and V2V(between virtual environments)
Vembu Universal Explorer

It is a tool that helps you recover individual items from various Microsoft Application backups like Exchange, SQL, SharePoint and AD.

- Instantly restore emails/mailboxes from MS Exchange
- Instantly restore MS SQL databases and tables
- Restore documents of MS SharePoint
- Granularly recover MS Active Directory items
Managing Backup Jobs

Using Vembu, you can automate the backup process by scheduling through the web console. Once set, the incrementals will run as per the configuration and no manual intervention is required.

- Add backup schedule window settings if you don't want to run incrementals during non working hours
- Auto Authorization feature ensures that only the authorized clients can connect to the BDR
- Bandwidth Throttling enables you to limit the bandwidth used by the backup process from the client machine
Vembu VMBackup - Architecture

- Vembu VMBackup agent will communicate with VMware ESXi production storage and backup the VM data
- The agent works as a proxy between the ESXi host and Vembu BDR Backup Server
Backup Transport Modes
Direct SAN Transport Mode

- Vembu VMBackup Client should have access to the SAN. It works on both physical server/FC or VM/iSCSI
- The VMBackup Client directly reads the data to be backed up from the SAN
- It sends them to Vembu BDR Backup Server's storage repositories

![Diagram showing metadata request and data transfer between VMBackup Client and Vembu BDR Server through the SAN]
Hot-Add Transport Mode

- Vembu VMBackup Client needs to be installed on any physical or virtual machine
- The virtual disk of the VM to be backed up can be directly attached to the Vembu VMBackup Client VM
- The Client will read the attached disks and send the data to the backup server's storage repositories
Network Transport Mode

- Vembu VMBackup Client agent can be either installed on physical or virtual machine
- The ESXi host sends the data to the VMBackup Client, from where it is sent to the storage repository
- The data transfer speed will be lower than the other two modes
Disaster Recovery Scenarios
Quick VM Recovery on any hypervisor

Instantly boot the backed up VM on VMware, Hyper-V and KVM by mounting to Vembu Virtual Drive.
Live VM Recovery

Restore the backed up VM permanently to the same or different ESXi host, Hyper-V host or KVM host
File Level Recovery

Restore files/folders from the backed up VM instantly without having to restore the entire backed up VM.
Instant Item Level Recovery - Vembu Universal Explorer

Vembu Universal Explorer helps you restore Exchange mails, SQL database/tables, SharePoint documents and AD Users/Roles granularly.
Vembu Virtual Drive

- Vembu Virtual Drive will be available in Vembu BDR Backup Server machine and for every VM, it will create an IMG, VHD, VHDX, VMDK, VMX and RAW files instantly.

- For every incremental schedule, full virtual hard disk files will be created without using any additional storage.
Licensing

Subscription

- Vembu offers licensing options for 1, 2, 3 and 5 years
- 24/7 support and major/minor upgrades included

Perpetual

- One time purchase with upgrades and support for one year
- AMC of 20% of license fee to be paid for continued support & updates

Available Editions

- Free
- Standard
- Standard Essentials
- Enterprise
- Enterprise Essentials
Pricing

- Vembu offers five pricing editions with features that cater to different levels of business requirements
